## **1<sup>st</sup> part**

### **Mind control machine**

#### **Presented to:**

**My great Professors - Faculty of Medicine**

**My lovely mother Eng. Samya Yassa Khalil**

## **An Introduction:**

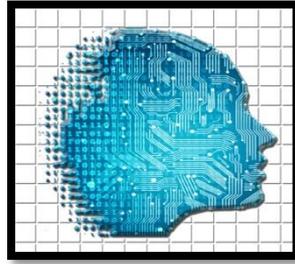

Mind Control Machine is a machine that has been used in both medical and military fields and has evolved over time to become the way it is now managed and controlled via satellites. In this small booklet, we review the medical effects of Mind Control Machine on the human and neurological activities of the brain and spinal cord as well as the nerves emanating from or return to them.

## **About the Writer:**

- **Name: Andrew Akoula Girges**
- **Graduated from the Faculty of Medicine**
  - **He is currently studying ENT**
  - **Very fond of science and technology**
- **He likes to read poetry and practice football**
- **Mathematics and physics of favorite materials**
- **He loves hiking amidst greenery and landscapes**

## **Content of the book:**

- 1 The nervous system inside the human body .. Page 5**
- 2 Integration of the hormonal system ..... Page 8**
- 3 History of Mind Control Machine (MCM) .. Page 11**
- 4 Continued, the various centers within the human brain ..... Page 14**
- 5 Memory and the mood of man ..... Page 18**
- 6 Control of the respiratory and digestive system ..... Page 22**
- 7 Sexual arousal ..... Page 24**
- 8 The Amazing Potential of Satellites ..... Page 27**
- 9 Damage due to the use of Mind Control Machine ..... Page 29**
- 10 The solution to such issues ..... Page 32**

## **1 The nervous system inside the human body**

The central nervous system (CNS) consists of the brain and spinal cord and is surrounded by a number of membranes called meninges to feed them and their number is 3 membranes and the name of them from the outside: Dura mater – Arachnoid mater - Pia mater.

A fluid called CSF contains glucose passes through them. Glucose is the main food of the nerve cell in general and the human brain in particular. This fluid is formed in certain cavities within the human brain. Brain cells die quickly when they are not supplied with glucose or oxygen, this explains the risk of coma due to hypoglycemia, and the infection of these meninges leads to the emergence of meningitis resulting in a high temperature and needs to transfer the patient to the hospital for appropriate treatment as well as specific doses of antibiotics to maintain the patient's life.

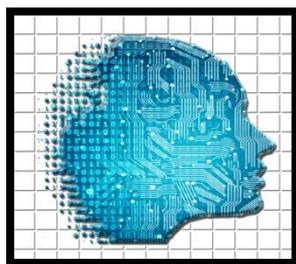

12 nerves come out of the brain and are connected to it through the brainstem. They are very important nerves and are responsible for key functions such as: optic nerve, auditory nerve, olfactory nerve, and vagus nerve. They are actually 12 pairs of nerves to feed the right as well as the left part of the body, while 31 pairs of nerves

emerge from the spinal cord and are located interchangeably so that the nerves emerging from the right feed the left part of the body while the nerves emerging from the left feed the right part of the body and this exchange occurs within the main axis of the spinal cord, it is responsible for movement as well as delivering the sensation of pain, temperature and touch in both types: fine touch, crude touch and when spinal cord injury occurs as a result of: road accidents or falling from high altitude or segmental wound using a sharp weapon paralyzes the body at the level below the affected part, for example, if the injured part is above, the patient loses the ability to move both hands and feet, while if the injured part at low level of the spinal cord, he loses the ability to move only his feet and so from the rest of the body, therefore, God created both the brain and spinal cord within strong skeletons to protect them from trauma. The neural signal starts from receptors found in almost all parts of the body. It is responsible for sensory signals and is sensitive to changes in the chemistry of the surrounding environment such as: pain receptors or taste or temperature change such as receptors in the human skin, which is similar to Sensors in mobile phones and modern devices, while the voluntary movement arises from higher orders issued by the human mind then signal transmitted from the brain then the spinal cord and then the group of muscles responsible for the target movement. The signal passes through the nerves in the form of an electric current (positive, negative) during the

body of one nerve, while moving from one nerve to another followed in the form of a chemical signal through certain neurotransmitters, including: Acetylcholine, norepinephrine are excreted from the body of the first nerve during synapses which separates it from the next nerve and then the signal passes through the next nerve in the form of an electric current (positive, negative) and then a chemical signal to the next and so on until the final signal arrives from or to: the brain or spinal cord to translate: (pain - hot or cold – touch – smell – or movement).

The nerve signal travels from the nerves to the muscles to induce movement by releasing calcium ions ( $\text{Ca}^{++}$ ), which reduce the size of the muscle to cause the intended movement. The movement of muscles is only a set of contractions or relaxations according to the hyphen signal and the occurrence of constriction in a group of muscles leads to relaxation in the corresponding muscles and vice versa as in the biceps and triceps of the human arm.

## **2 Integration of the hormonal system**

The nervous system does not work in the human body alone, but integrates with the hormonal system to form together various feelings and felt by the human.

Hormonal system consists of a number of endocrine glands that secrete hormones in the blood directly. The most famous of them is the pituitary gland in the human brain that considered the Maestro & the head of the rest of the other endocrine glands in the human body and regulates their work as well as the level of secretion of various hormones, but the signal reaches the pituitary gland from a higher part of the brain called the Hypothalamus to regulate the secretion of the rest of the other hormones, mostly hormones secreted by it are stimulant to the rest of the endocrine body's glands.

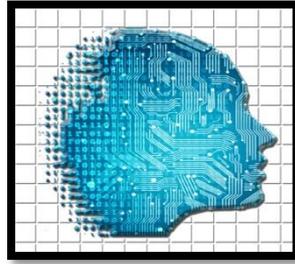

Serotonin and dopamine are hormones responsible for the feeling of happiness or satisfaction and achieve achievement and their secretion increases with eating some foods and the most famous of course is chocolate or access to the state of sexual satisfaction as well as when achieving a sporting victory or academic success, their excretion is also linked to the reward no matter how many. There are many other hormones that affect the

psychological state of man or control his feeling or sense of happiness and their absence affects on human mental health and causes an individual feeling frustrated or depressed. Other hormones include Oxytocin, which is responsible for the uterine contractility during childbirth and increases during the mother's embrace of her baby, as well as in cases of lap between two lovers. It expresses love and affection between people. The current flows through the nerves in the form of an electric current and the voltage is positive outside the neuron and negative inside. The current starts when the sodium  $\text{Na}^+$  ions outside the neuron enter inside and are followed by the entry of many ions along the axon of the cell, this causes the original voltage of the nerve cell in the dormant state to become negative outside and positive inside. This state is called (the excitation state of the nerve cell as a result of an effect). It then proceeds to transfer the signal to the next cell and so on as we mentioned before. A nerve consists of millions of neurons and the current is transferred in one direction from the axis of the neuron to its center, not vice versa.

Now the nerve inside the human body has an electric current that resembles the electrical current flowing in copper wires, but it is a vital current that results from the excitation of living cells, but like any electrical current which an electromagnetic field is created around it and therefore can be affected by any other electromagnetic field such as the electromagnetic field of radio waves or electromagnetic radiation from a remote satellite, as we

can measure the electrocardiogram of the heart by an electrocardiogram (ECG) or a patient's cardiac resuscitation by an (ICD) in case of accidents or cardiac arrest.

### **3 History of Mind Control Machine (MCM)**

Mind Control Machine dates back to a joint US-Soviet program using long radio waves to influence certain centers in the brains of animals and because each part of the animal's brain is responsible for a particular feeling. A change in animal behavior was observed depending on the excitement of a part, for example, when provoking Area A, the state of laughter of the animal, anger when provoking Area B, crying when provoking Area C, or tension and uncertainty when provoking Area D were observed. This is more pronounced in higher mammals such as monkeys and it is more complicated in humans because it has the most advanced and complex nervous system among all living organisms and now we can draw a map of the brain that determines the spot or area responsible for a particular feeling or sensation. The machine developed later and can be used via satellites. You have a wide electrical network inside the human brain. Using electromagnetic waves from the satellite, you can record any electrical activity of the brain just as you can record any other electrical activity. Airplanes flying in the sky of drones need to be directed by a satellite, so the human mind can be read, directed or

controlled remotely using the Mind Control Machine already in the body of the moon swimming in space.

Therefore, this machine was used as a non-lethal war weapon that controls the human mind, controls drones or monitors the military equipment of the enemy army, but how was a map made or drawn to the brain?

By carefully dissecting the nerves of the human body and tracking their path, observing the part that is disrupted in the human body as a result of an injury or accident in a particular spot of the human brain and the various types of paralysis caused by brain clots (such as paraplegia - or quadriplegia) and the behavior of the individual as a result of stimulation of a particular spot. The following areas were identified from his brain:

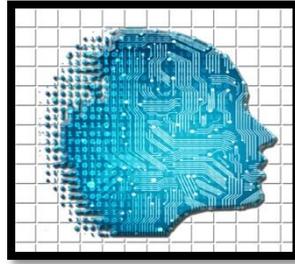

1. Area (3,2,1): Most of the emotional sensations in these areas are identified and translated. Here, the feeling of pain and touch (both fine and crude) as well as tingling and feeling of heat or cold or chills and other sensory feelings in these areas is translated and reached by nerves all over the body through the spinal cord. If you hold your house key in your hand, get hit in your foot, or sting a pin in your abdomen, all of this is translated into the area (1,2,3) and is called in medicine Sensory area (1,2,3).

2. Area (4): Responsible for most of the voluntary movements carried out by the human being, it sends nerve signals to various muscles of the body from the head to the feet, you move your hands or feet based on a

nerve signal from the Area (No. 4) and called in medicine Motor area (4).

A part called the Brainstem, which is several centimeters in length, connects the brain and the spinal cord. The importance of this part is the transit of nerves coming from different parts of the body. In this part, the nerves coming from the left side cross to the right side and that coming from the right side cross to the left side.

There are also pulse and breathing centers, which explains why a person dies quickly when he is hanged from the neck or when a fracture of his neck occurs if he falls from a high altitude or in a highway accident, this is because the heartbeat stops immediately and the breathing muscles, including the diaphragm muscles, are unable to perform inhalation and exhale anymore.

## **4 Continued, the various centers within the human brain**

The center of vision is located at the back of the brain and is called area 17, which translates the image connected to it by the optic nerve. To further analyze the image and color, this area is connected to two other adjacent areas, namely, 18,19 via a neural pathway. They give a greater explanation and detail of the image formed in area 17, and a person is blinded if his head is hit by a solid object and any of these areas is hit. Area 17 is the main area and the other two are secondary. The hearing and speech center is located in the 41,42 regions of the brain and translates the voices delivered to them by the auditory nerve. The auditory nerve is divided into two parts: one responsible for hearing and another responsible for balance and locating. You can locate the sound you hear even if you don't see it. For example, on the right, left, forward or backward, the cerebellum is involved in the state of equilibrium that the human being during walking or movement. The cerebellum is the left and right lobes, located directly below the hemispheres of the brain and injury to the nerves in the cerebellum causing a state of ataxia to humans while walking as well

as inaccuracy in directing his hands or feet when moving or grabbing an object. The center of speech and writing for the right handed is located in the left hemisphere of the brain, while the same center for the left handed is located in the right hemisphere of the brain, a natural composition of the creation of God Almighty and it must not force the left-handed to write by his right hand because it violates the nature of its composition. The same is true for the ball player who plays with the left foot. This, as we said, is a natural composition, but the vast majority of human beings use the right hand and foot, and a minority of them use the left hand and foot, and some of them can train themselves to use both: both the right and left hands or both the left and right feet.

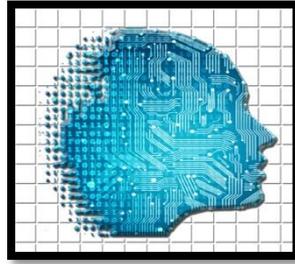

We can distinguish between the tens of thousands of foods we eat and the tens of thousands of smells we smell, but how is this done?

In the human tongue there are thousands of sensory receptors that generate a nerve signal depending on the chemical change in the middle. For example, when we eat something sweetie material in, it raises a number of receptors, let it 10 on the tongue in the human mouth that sent 10 different nerve signals to the brain which translates them to this sweetie thing and retained in his memory if taken again after that. There are substances that excite 20 receptors or 30 receptors translated by the brain to the smell (B) or (C) as well as perfumes you go to the perfume shop and makes you smell more than one

smell to choose between,, similarly fragrance (A) effects 100 receptors in the nose and fragrance (b) effects of 200 receptors and (c) 300 receptors and so on ..... Each number of receptors expresses a specific taste or smell, so we can differentiate between a large number of foods or odors by the number of receptors raised in the mouth or nose at the same time and often the sense of smell is related to the sense of taste because the translation is done in the same way, the chemical change in the middle as in the nose or tongue.

Receptors are also found in human skin responsible for the sensation of temperature. There are two types of receptors: a type of feeling of heat or rise in temperature and another for cold or low temperature within certain limits, but extreme heat or combustion or extreme cold or freezing may cause damage to these receptors, because first and foremost they are chemical receptors and start signaling neuronal (electrical) by chemical change, but when burning, for example, receptors are damaged and the body secretes a number of inflammatory substances that cause skin redness and send a nerve message that there is damage or imbalance and the pain associated with them is very severe. Pain is usually the sensation that warns the brain of a problem somewhere, and diabetes causes an inflammation of the peripheral nerves in which the patient loses the sensation of pain so it is possible that the diabetic person's foot is injured and does not feel anything because his damaged peripheral nerves did not warn of a defect or problem. As a result, diabetic

foot complications, if not treated properly, may result in amputation of the patient's toes or the part of the foot that is rotting and is not reached by the appropriate blood or nervous supply.

## **5 Memory and the mood of man**

The hemispheres of the brain have two memory centers: one for long memory, called the primary memory center and another for nearby memory, called the secondary memory center. Both are a neuronal circuit connected to each other, as in electrical circuits, and calcium  $Ca^{++}$  extends the life of the information that round in this circuit by prolonging the neural activity of these circuits and the information moves from the nearby memory to the long memory. The brain daily records new information that begins to circulate in the memory centers to replace the old information. That is, the information is forgotten by the statute of limitations and part of it can be retrieved the one you hold in your long memory. But how does Mind Control Machine scan memory?

The information must be recorded first on Mind Control Machine and the information is only an electrical circuit inside the brain. If we supply the electrical circuit with the opposite activity of the neuron inside, we would be able to erase this memory as in the computer. If the value of the information is 1 0 1 we have to enter the value 0 1

0 and the new value reflects the existing value and the memory is cleared.

All we have to do is reverse the neuronal activity of the information recorded in the brain with a neuronal activity against the original value, as the introduction of the same information, but vice versa, as the addition of antimatter to the original material leads to the annihilation of both together. Meeting of the both leads to their own destruction, such as the Delete or Format commands on the computer.

Limbic system plays an important role in determining human behavior according to the information recorded on it; for example, you are a quiet or nervous person – speak much or a little - make fast or slow movement, all these behaviors and natures according to the data recorded on the Limbic system and shared with that Frontal lobe and together identify human behaviors and general nature, the limbic system controls in the human mood if you feel anger, calm, satisfaction all this according to the current imprint of the limbic system in conjunction with some of the hormones that we have mentioned before, therefore, Mind Control Machine (MCM) can change your mood and make you laugh instantly or make you feel tired, alienated or bored by manipulating the nerves and provoking them through the limbic system, the process of arousing or inhibiting your limbic system completely controls your emotions.

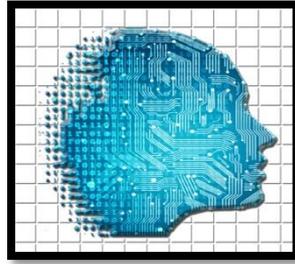

Mind Control Machine can cultivate an idea inside the human mind or a particular image because it makes your mind like a hard disk that you can write on, erase, or transfer from. Of course, these images translated by the vision centers in the area 17,18,19.

It can also send voice messages over radio waves that you can hear with your ears. This method has been used to brainwash the target cases tested by Mind Control Machine. This machine can also create a ringing in the ear as well as audio messages.

There are centers of nausea and vomiting in the Brainstem called the main or central, which are the anti-nausea and vomiting drugs work through them and by provoking these centers can cause nausea to the target state or make them vomit. You fully control the psychological state or mood of the person under the control of Mind Control Machine.

This machine can also make nervous spasms by involuntary control of the muscles of the body, as in cases of epilepsy. If you control the nerves nourishing the muscles, you can actually control them, as well as making dizziness for the target person because there is a nerve network always excited within the brain in a state of waking, when this network is inhibited, humans begin to feel sleepy or enter sleep and by inhibiting this network we can make a person dizzy or drowsy because the human nervous system contains a set of inhibitory nerves that cause inhibition to nerves after that and also

contains those that cause the excitement of the next nerves by certain neurotransmitters such as GABA that is Inhibitory for nervous activity.

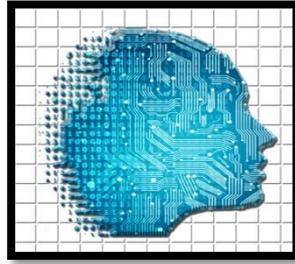

## **6 Control of the respiratory and digestive system**

The bronchioles have special receptors called Beta 2, by activating these receptors, we can expand the bronchioles the same act of chronic anti-asthma drugs, and these drugs activate the beta 2 receptors, making them break the popular constriction caused by chest allergy and histamine compounds. Mind Control Machine can reduce the air entering the lungs in two ways: the first is by Bronchospasm, the same effect as asthma by narrowing bronchioles, allowing a small amount of air to enter. The other method is Hyperventilation, a method that makes the bronchioles always open and therefore the amount of air remains the same and there is no natural exchange of gases, as in the case of inhalation and exhalation, because the breathing process needs both, an open trachea with bronchioles as well as alveoli during the inhalation process and constricted bronchi and similar bronchioles and alveoli during exhalation either make them always constricted or always open harassed by the patient's breathing and makes the process of gas exchange is not good, this usually affects heavy smokers in the second case in a disease known as: Chronic Obstructive Pulmonary Disease or COPD in the

advanced stages of the disease after continuing the bad smoking habit for decades, making all airways always open and this affects the patient's natural breathing.

The intestines have a special worm movement that works to push food through the digestive system from the esophagus to the anus and the process of ejection. This worm movement is disturbed when the gastrointestinal tract is infected with an intestinal microbe, causing intestinal colic that affects the human, and these are persistent cramps in the human intestines to alert the brain to the presence of disorder or foreign body. Mind Control Machine can cause false cramps of the stomach and intestines that cause flatulence of a person without a problem or obvious cause and accumulate gases in his intestines, which makes him feel full and with it a feeling of nausea.

In some chronic cases of gastrointestinal diseases, the intestines reverse the normal worm movement created by God, pushing food in the opposite direction towards the esophagus and this causes cases of vomiting to the patient until he gets rid of the problem or chronic disease. Anti-cramping drugs relax the smooth muscles in the intestine and thus reduce their contractions, similarly, cases of renal colic affecting the urinary system, especially the ureter and Mind Control Machine is able to simulate these contractions as well.

## **7 Sexual arousal**

Sexual arousal is a subconscious process controlled by the human mind. There are many factors that lead to sexual arousal, such as: a picture or a certain scene by talking or touching or through a certain smell and immediately arousing the human mind sends nerve signals to the genitals to make them erect. It occurs in the female exactly as it happens in the man and as there is an erection of the male penis, there is an erection of two parts called the Clitoris in the female and provoke any of them make the male or female in an urgent situation to enter into intimacy and Mind Control Machine can reach the man or female to this situation even if there is no sexy canonical.

Rather, it can make the process of ejaculation of the male or orgasm to a male or female under the control of the machine and this shows how the machine controls the human if it controls the sexual processes, is similar to the effect of the blue pill on men and the other pink recently used on women and proved its effectiveness.

By affecting the temperature receptors in the skin, you can make a person feel a hot or cold spot on the surface

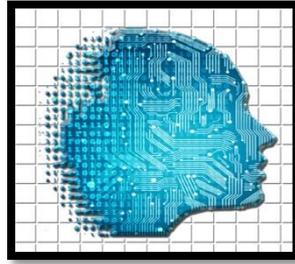

of his skin, which is certainly a false sense because it is without touching the surface of a hot or cold body.

Itching can soothe the pain because it makes the brain preoccupy with the interpretation of Crude touch rather than pain sensations that pass through the nerve pathways.

Mind Control Machine can record the nerve imprint of smells that you smell before or the foods you have tasted before on servers of huge computers, and to give you the same footprint while another even in the absence of the effect, it makes you smell orange smell, for example, although you do not hold one in your hand or smell the smell of roses in the garden completely away from you or the smell of barbecue in the absence of a barbecue party, as well as various foods bananas or apples or mangoes, albeit in the off-season, and all these abnormal sensations were recorded and created electronically to manipulate the human brain and control it electromagnetically.

The pain felt by man is divided into two types: general pain resulting from the injury of the external areas and internal or visceral pain and resulting from injury to the internal areas and by controlling the course of the pain nerves, whether general or internal you can actually make the target person feels very painful sense and it is also by electronically way.

Where the nervous path is stimulated to warn the mind falsely that there is pain in the chest and chest area is already healthy and does not suffer from any symptoms or that the colon ruptures from the intensity of pain and the colon is free of all problems, so this machine can torment the human and make him feels pain excruciating, this in case you try to take revenge or tamper with the target and try to harm him electronically, as mentioned before, you have been called Mind Control Machine with a non-lethal weapon to torture your victim electrically however you like.

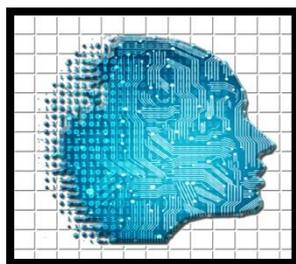

## **8 The amazing potential of satellites**

The giant modern satellites have amazing potential. They are able to change the temperature of the atmosphere in the areas they cover, as well as create artificial rain, all through the huge electron beams coming from and back to them, as well as in the terrestrial mobile networks that cover your mobile network. It sends and receives electromagnetic signals, which is the same idea that Bluetooth works between modern devices or Wi-Fi networks.

Spy satellites have giant cameras capable of taking clear images of areas of the globe such as those shown on Google Maps. All these images are captured by satellites, even the giant search engine mentions in its maps that the images are taken by satellite. You get closer and closer to the place you want. In the past, these features were used to spy on military areas and with the open skies today, you can reach anywhere you want and photograph military or non-military places.

Developed countries today mention the term: satellites for espionage purposes or to study weather conditions, marine or geological areas, telecommunications, etc.

Such satellites can also cut off electricity to a specific area or disrupt the operation of a particular device: an air conditioner, a recorder, computers, televisions and even cars, like any other remotely controlled war equipment (such as drones), as we mentioned before, every electric field creates a magnetic field and every magnetic field can affect or be affected by another magnetic field and there is nothing in the sky that is larger than a satellite that broadcasts signals to hundreds of thousands of dishes (that is, antenna dishes on rooftops).

## **9 Damage due to the use of Mind Control Machine**

With reading human minds, there is no safe from espionage or eavesdropping on human freedom, but suppressed this freedom, imagine that someone inside your head and watching you all the time and knows the finer details of your life. How can you admire or exchange the girl who loves you kisses of love and romance, there is a third Satan between you all the time.

How can you breathe or go to the toilet? Or keep your bank accounts or passwords away from thieves? How do you secure disputes with your neighbors, opponents at work or enmities in general and there are those who know the finer details about you? How do you enter into an intimate relationship with your wife? How do you get rid of anxiety or tension and your nerves are controlled by the machine and even deterred giant entities such as those that own or operate satellites for them?

This machine was designed to eavesdrop on the human brain as hackers snooping on computers and in fact caused injustice in human history by the owners of these machines to seize the ideas of others and exploit them in their favor, such as those who seize your bank account to

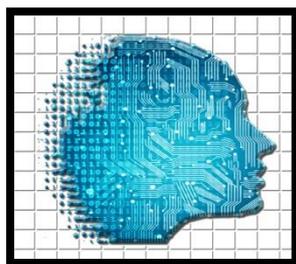

make it zero and leave you nothing of money, but in such a situation he steals your entire life because he is the owner of the one that has more advanced equipment and thus prevail in the interest of the strongest.

The satellites today are able to eavesdrop on calls and thus monitor the Internet to make freedom nothing or a mirage in favor of governments and the owners of satellites and instead of the world becoming a small village, it became a mere changing room in one of the big brand shops and inside this room, 100 surveillance cameras became like someone who stood standing in his panties in front of the owner of this shop or a miss who photographed and blackmailed them with such pictures.

There is no security or safety in light of this huge development in technology without censorship or laws that prevent the arrival of such machines and falling into the hands of saboteurs or criminals, they fear nothing and consider the human a small doll they can manipulate at will. It is like a US or Soviet-made nuclear weapon falling into the hands of a mafia gangster. If one Don gets angry with another competitor, he goes to blow up his bar or his gambling hall with a nuclear bomb.

Images appearing in Google Maps also violated privacy and resulted in complaints about the emergence of places or people in these pictures without their knowledge or written permission from them. Foreign and European countries commented on concerns about these images and we need laws requiring all countries to establish

explicit and specific laws that respect the privacy of individuals.

## **10 The solution to such issues**

With this unlimited technological ambition that has reached the human mind to steal his thoughts and race to reach other planets, the United Nations must adopt strict laws limiting the use of satellites in espionage as well as laws regulating the invasion of space and the use of the wealth of other planets and meteorites nearby, so that you never hear a conflict between two states over a property on the moon or for riches on a planet.

It is a serious ambition that may delay progress if you lose control of it. Mind Control Machine is similar to human organ trade but in a better way you enter the mind of the target victim and control it at will. The conflict over the wealth of nearby planets and meteorites is similar to the struggle over pastures and water sources that occurred between ancient kingdoms, also, the ambition to develop a robot may result in very advanced robots that may lose control if a software malfunction occurs or the machine is malfunctioned. Technology is a double-edged sword and you must calculate the cost of the other limit so as not to turn against you and be the cause of destruction and lose all the rescue efforts for your problem because you aspire to technology that

exceeds your capabilities or exceeds the safety standards you have already set for it. The world must listen to the wise people who warn of the dangers of espionage, of the advanced countries invading space and of the dangers of advanced robots and cloning on the human race.

Technology lunatics, such as those who play with fire in their hands, either turn on it and burn it or fall into the hands of those who are less intelligent cause destruction of themselves or their communities or the world at large.

It is not right to hold a 5-year-old child with a gun stuffed in his hand or riding a 10-year-old boy car Ferrari on the highway. Everything has the allowed limit and if something exceeds its limit, turns against it.

Done ....
